WIRELESS VIDEO VERIFICATION ALARM

Sicuro's wireless video verification alarm system is ideal for Construction sites, Vacant properties and other remote locations without access to services such as mains power and internet connection.

Given the alarms wireless and battery-operated capabilities it can be installed anywhere within a matter of hours and due to the systems portability, it can be adjusted and relocated as a site evolves with ease.

The PIRs have integrated cameras which generate 10 second video clips upon activation. The alarms are then sent through to our NSI Gold accredited monitoring station for verification within seconds. In the event of a genuine security breach an approved responder will be dispatched to site.

The system has up to a 4 year battery life expectancy based on average conditions and all systems are fully maintained by Sicuro, giving you a cost effective and hassle-free security solution.

ACTIVATION PROCESS
